KPS Travels: Comprehensive Project & Handover Documentation

Date: April 7, 2026

Project: KPS Travels Web Platform

Domain: kpstravelscbe.com

Purpose: A complete architectural overview, feature summary, and technical handover guide detailing the development cycle from initial concept to production deployment.

1. Executive Summary

This document serves as the official technical blueprint for the KPS Travels web platform. Built to modernize a local travel and cab service agency in Coimbatore, the project evolved from a basic static landing page into a fully-fledged, responsive web application featuring custom dynamic booking calculators, a secure PHP/MySQL backend, an administrative control panel, and real-time Google Sheets automation.

2. Frontend Architecture & UI/UX

The frontend was engineered with a strict adherence to modern, premium aesthetics without relying on heavy frameworks, ensuring maximum performance and SEO score.

Tech Stack: Vanilla HTML5, CSS3, ES6 JavaScript.

Design Philosophy: Implemented a modern, responsive "glassmorphism" aesthetic with vibrant gradients, custom typography, and fluid micro-animations to create a high-trust, premium user experience.

Core Pages:

index.html (Landing & Booking flow)

services.html (Offerings)

routes.html (Popular destinations)

our-fleet.html (Vehicle showcase)

feedback.html (User reviews)

Dynamic Booking Engine (js/booking.js & js/main.js): Engineered a highly complex frontend booking calculator handling four distinct user flows:

Local Trip: Distance & hourly calculations.

Outstation: Multi-day logic.

Drop / One-way: Point A to Point B mapping.

Round Trip: Intricate day-calculation logic resolving edge-cases parsing "No. of Days".

Dual-Channel Lead Capture: Forms simultaneously trigger a formatted WhatsApp deep-link generation for instant communication while pushing the payload to the backend database.

3. Backend API & Database (PHP/MySQL)

The backend handles central persistence and state management for the agency.

Database Engine (database.sql): MySQL. Comprises two primary normalized tables:
inquiries: Stores comprehensive lead data (Pickups, Drops, Vehicle Types, Dates, Status, Price).

feedback: Stores users submitted 5-star rating metrics and review messages.

RESTful API Structure: Hand-written PHP endpoints bypassing heavy ORMs for speed.

Submission: `submit\_inquiry.php`, `submit\_feedback.php`

Retrieval: `get\_inquiries.php`, `get\_feedbacks.php`, `get\_history.php`

Updates: `update\_status.php`

Security Implementations:

SQL Injection Prevention: 100% utilization of parameterized queries (`mysqli\_real\_escape\_string` and prepared statements).

CORS Restriction: Strict Origin enforcement. Endpoints reject all payloads outside of `kpstravelscbe.com` and `localhost`.

4. Administrative Dashboard

To allow KPS Travels staff to manage operations without direct database access, a bespoke admin portal was constructed.

Location: `/admin/index.php`

Features:

Lead Pipeline: Visual categorization of "New" vs. "Completed" inquiries.

Status Toggling: Staff can mark jobs as complete and attach final billed amounts (`price`), which instantly syncs to both the SQL database and the Google Webhook.

Analytics: Dashboard counters pulling realtime aggregate statistics from `get\_inquiries.php`.

5. Third-Party Automations (Google Workspace)

To accommodate the client's operational preference for spreadsheet tracking, bridge middleware was built.

The Webhook: A Google Apps Script (`google\_script\_instructions.txt`) operates as a secure Web App.

Data Flow: When `submit\_inquiry.php` or `update\_status.php` fires locally on the server, a secondary asynchronous cURL request posts a JSON payload to Google.

Security Handshake: To prevent span injections into the client's spreadsheet, the Google Script mandates a hardcoded `secret\_token` (`KPS\_SECURE\_AUTH\_8842`). Unauthorized POST requests are explicitly rejected.

6. Deployment & Infrastructure

The project utilizes a split-infrastructure model.

Domain Registrar: HostingRaja (`kpstravelscbe.com`).

Hosting Environment: Hostinger Shared/Cloud environment.

DNS Resolution: Custom Nameservers (`helios.dns-parking.com` & `aster.dns-parking.com`) were implemented at the HostingRaja registrar level to point to the Hostinger instance.

Data Sanitization Checklist: Prior to deployment, a comprehensive SQL truncation was performed on Hostinger's phpMyAdmin to reset all auto-increment IDs (`reset\_for\_deploy.sql`) guaranteeing true Day 1 analytics.

Notes for Future Developers

If you are onboarding onto this project, please adhere to the following established paradigms:

- 1. Local vs Live:** The `api/config.php` utilizes auto-environment detection. DO NOT hardcode database credentials. It will natively switch from `root` local environments to Hostinger user credentials automatically.
- 2. API Modifications:** When pushing updates to the `api/` directory, ensure the CORS whitelist arrays remain intact.
- 3. Google Script Edits:** If spreadsheet formats change, you must update the Apps Script via Google Workspace and redeploy as a **"New Version"**. Merely saving the script does not push the update live to the webhook URL.
- 4. JavaScript Formatting:** The WhatsApp string generation inside `booking.js` is highly sensitive to whitespace and line-breaks. Alter with caution.
